

GWAITH GWELLA CYNEFIN AFON DDU (RHAN 5) AFON DDU HABITAT RESTORATION (PHASE 5)

7/8th October 2015 works

Upper Section: Gravel (5-50mm grade local Grainanog glacial till material) formed as a stockpile for gradual reintroduction. Boulders placed in the slow moving section downstream of the lake. The boulders in this section were clean stones sourced from the several piles in adjacent fields.

Lower gravel stockpile at the start of the higher gradient section. This gravel is expected to be dispersed more quickly than the upper stockpile. Boulders placed in the river were originally removed from the channel in 1995-6.

Various boulders replaced in the lower section.

Removal of the barrier to fish passage formed by the sheep washing pool structure at the lower end of the section.
